### 1. Introduction

The Planning Group on Commercial Catch, Discards and Biological Sampling (PGCCDBS) meeting in March 2012 recommended a large exchange (ICES, 2012).

The planning group indicated that the IFREMER, France should be responsible to organising a saithe otolith exchange (ICES, 2012).

There was the first exchange in 2005-2006 and so the exchange in 2013 is the second exchange for saithe.

There was not workshop after the first exchange because the agreement among readers during the first exchange was very high.

## 2. Participants

13 readers from 5 institutes participated at this exchange (Tab. 1).

Reader Firstname Lastname Institution Country Institut français de recherche pour l'exploitation de la 1 karine Sevin France mer 2 Pétursdóttir Marine Research Institute MRI Gróa Iceland Gudrun Finnbogadottir Marine Research Institute MRI Iceland 3 4 Wilhelms Germany Ines Johann Heinrich von Thünen Institute (Germany) 5 Beußel Friederike Johann Heinrich von Thünen Institute (Germany) Germany Barbara Bland Swedish Board of Fisheries (Sweden) 6 Sweden 7 Lisbet Solbakken Institute of Marine Research (Norway) Norway Silje 8 Seim Marine Institute Norway Elisabeth 9 Else Holm Institute of Marine Research (Norway) Norway 10 Institute of Marine Research (Norway) Hildegunn Mjanger Norway 11 Harald Senneset Institute of Marine Research (Norway) Norway 12 Merete Vik Ottesen Institute of Marine Research (Norway) Norway janicke Skadal Institute of Marine Research (Norway) 13 Norway

Table 1: List of the readers.

Appendix 1 presents the complete listing of the participants in the Saithe otolith exchange.

Sampling collection 5

# 3. Sampling collection

A total of 295 fish was sampled (Fig. 1 & 2):

❖ 24 fish from the Barent sea (ICES area : IIa) by Institute of Marine Research (Norway)

- ❖ 34 fish from the North Sea (ICES area : IV) by IFREMER institute (France)
- ❖ 237 fish from the Western Scotland (ICES area : VIa) by IFREMER institute (France)

The length range of the fish was between 37 and 96 cm, with mean 60 cm (Fig. 1).

Figure 1: Histograms of the samples.

Reading procedure 6

Figure 2: ICES Areas of sampling 5 (red areas).

## 4. Reading procedure

Date of birth is set to the 1<sup>st</sup> of January as convention. One *annulus* consists of one opaque and one translucent zone. For the age estimation, we count the translucent zones.

All otoliths and scales were digitalised by TNPC software. All participants received all informations to participate to this exercise in the WebGR tool.

The WebGR tool was used to this exchange. The use of WebGR tool for the exchange has somes advantages: (i) it can facilitate and accelerate the whole exchange process, (ii) annotated images are obtained for every otolith which enables to compare age readings directly and to identify possible sources of bias (iii) it is very easy for the chairman to compile the results.

However, the use of WebGR tool for the exchange present some limits: (i) the WebGR tool is not very intuitive tool (ii) the WebGR could be jam (as during the half of the 2013 year) (iii) it is not possible to upload always a large batch of images (problem with the format of the csv file with Windows 7).

## 5. Results

The spreadsheet (Eltink, 2000) was completed according to the instructions contained in Guidelines and Tools for Age Reading Comparisons by Eltink *et al.* (2000). Modal ages were calculated for each otolith red, with percentage agreement, mean age and precision coefficient of variation as a definition (for each otolith):

• percentage agreement = 100x(no. of readers agreeing with modal age/total no. of readers).

Results 7

 $\diamond$  precision c. v. = 100x(standard deviation of age readings/mean of age readings).

### 5.1. Precision<sup>1</sup>

The analyse presented the results with 13 readers. Mean precision of age estimate for individual fish were Coefficient of Variation (CV) of 6.2% and percent agreement to modal age of 85.9 (Tab. 2). Among 298 fish, 54 were read with 100% agreement (18%) and thus a CV of 0%. There were variations in precision of age estimate between individual fish, with CV ranging from 0 to 27% and percent agreement range from 40 to 100% (Tab. 2). Appendix 1 examined the readings of individuals at each modal age and summarised the number of otoliths, the precision CV, percentage agreement.

1 4010 2 . 1 10	cision of readin	gs from otoffins, fi	om scales and mom both	carefrica pieces
ICES area	Number	Age range	Percentage of Agreement (range)	CV (range)
All samplings	298	2/14	85.9% 40/100	6.2% 0/27
lla	24	4/12	83% 55/100	5.6% 0/17
IV	34	9/14	74.2% 42/100	4.2% 0/8
Vla	237	2/13	87.9% 40/100	6.5% 0/27

Table 2: Precision of readings from otoliths, from scales and from both calcified pieces.

Precision of Age estimation from the North Sea was not as good as than those of the others areas. However, the size and age of fish from the North Sea were bigger than those of the others areas (Tab. 2)

## 5.2. Relative bias (Accuracy)<sup>2</sup>

The minimal requirement for age reading's consistency is the absence of bias among readers and through time. The hypothesis of an absence of bias between two readers or between a reader and the modal age estimated can be tested non-parametrically with a one-sample Wilcoxon signed rank test (Tab. 3).

<sup>&</sup>lt;sup>2</sup> In absence of calcified structures of known age, the age readings can be compared to modal age, which is defined as the age determined for an individual structure whose most of the readers have a preference. Relative bias can be defined as a systematic over- or underestimation of age compared to the modal age. The age reading comparisons to modal age provide a low estimate of relative bias compared to absolute bias, when most readers have a similar serious bias in age reading (ICES, 2007).

<sup>&</sup>lt;sup>1</sup> Precision is defined as the variability in the age readings. The precision's errors in age readings are better described by the coefficient of variation (CV) by age group. This measure of precision is independent of the closeness to the true age (ICES, 2007).

Table 3: Inter-reader bias test and reader against modal age bias test (-: no sign of bias (p>0.05); \*: possibility of bias (0.01< p<0.05); \*\*: certainty of bias (p<0.01)).

It should be noted that there are certainly of bias between some readers and modal age.

The differences are primarily explained by the position and the number of rings after the eighth and closed the edge. The following annotated images for one otolith with agreement percentage of 42% and CV of 8% presents the estimated age from 9 to 12 years old, is a good example (Fig. 3).

Figure 3: Saithe of the North Sea (ICES area: IV), modal age: 10; age estimated from 9 to 12 with a majority at 10 years old, agreement percentage of 42% and CV of 8% with 13 readers. Difference in annotation on the same image: disagreement on the position and the number of rings after the eighth ring (exception of the first ring).

Reader 12

Images of reference 9

# 6. Images of reference

There were some images with 100% agreement in all sampling areas. 3 images were selected (Fig. 4, 5 & 6).

Figure 4 : Saithe otolith image from the Barent Sea with 100% of agreement, 6 years old (from 13 readers). Total length was 70 cm.

Figure 5 : Saithe otolith image from the North Sea with 100% of agreement, 10 years old (from 13 readers). Total length was 90 cm.

Figure 6 : Saithe otolith image from the North Sea with 100% of agreement, 12 years old (from 13 readers). Total length was 90 cm.

Abstract 10

#### 7. Abstract

The ICES Planning Group on Commercial Catch, Discards and Biological Sampling (PGCCDBS) identified the need of a Saithe (*Polliachius virens*) otolith exchange to take place in 2013. It was the second exchange after that's of 2008.

The IFREMER institute coordinated this exchange. A total of 295 fish was sampled from the Barent sea (ICES area: IIa, N=24), from the North Sea (ICES area: IV, N=34) and from the Western Scotland (ICES area: VIa, N=237). The length range of the fish was between 37 and 96 cm, with mean 60 cm

13 readers from 5 countries (France, Germany, Iceland, Sweden & Norway) were participated. Mean precision of age estimate for individual fish were Coefficient of Variation (CV) of 6.2% and percent agreement to modal age of 85.9. Among 298 fish, 54 were read with 100% agreement (18%) and thus a CV of 0%. There were variations in precision of age estimate between individual fish, with CV ranging from 0 to 27% and percent agreement range from 40 to 100% (Tab. 2).

Precision of Age estimation from the North Sea was not as good as than those of the others areas. However, the size and age of fish from the North Sea were bigger than those of the others areas. The differences are primarily explained by the position and the number of rings after the eighth and closed the edge.

## 10. Appendix 2 : Details results of Saithe from ICES IV

NUMBER OF AGE READINGS

The number of age readings, the coefficient of variation (CV), the percentage of agreement and the RELATIVE bias are presented by MODAL age for each age reader and for all readers combined. A weighted mean CV and a weighted mean percent agreement are given by reader and all readers combined. The CV's by MODAL age for each individual age reader and all readers combined indicate the precision in age reading by MODAL age. The weighted mean CV's over all MODAL age groups combined indicate the precision in age reading by reader and for all age readers combined.

In the age bias plots below the mean age recorded +/- 2stdev of each age reader and all readers combined are plotted against the MODAL age. The estimated mean age corresponds to MODAL age, if the estimated mean age is on the 1:1 equilibrium line (solid line). RELATIVE bias is the age difference between estimated mean age and MODAL age.

The coefficient of variation (CV%), percentage of agreement and the standard deviation (STDEV) are plotted against MODAL age. CV is much less age dependent than the standard deviation (STDEV) and the percentage of agreement. CV is therefore a better index for the precision in age reading. Problems in age reading are indicated by relatively high CV's at age.

The distribution of the age reading errors in percentage by MODAL age as observed from the whole group of age readers in an age reading comparison to MODAL age. The achieved precision in age reading by MODAL age group is shown by the spread of the age readings errors. It appears to be no RELATIVE bias, if the age reading errors are normally distributed. The distributions are skewed, if RELATIVE bias occurs.

# 11. Appendix 3: Reference images of the Saithe from the ICES IV (100% agreement)

Saithe of IVa, agreement percentage of 100 % with 20 readers of 10 countries.

# 12. Appendix 4 : Reference images of the Saithe from the ICES VI (100% agreement)

Saithe of VI, agreement percentage of 100 % with 18 readers of 10 countries.
